## **Asbestos Cladding Removal**

Carefully and professionally executed removal and safe disposal of asbestos materials as well as over-cladding works. Free advice offered for all potential projects.

Chrysotile asbestos cement roofs are often found in industrial buildings and with growing concerns over asbestos, companies are hiring specialist organisations to remove the material safely and quickly.

Removing asbestos is not something to take lightly. That's why, all of our teams are fully trained on the requirements of working with and around non-licensed chrysotile asbestos. We also train our people to be able to identify the risks associated with licensed asbestos products such as amosite and crocidolite.

We work with a nationwide network of licensed asbestos removal contractors to ensure any licensed work you require is dealt with professionally and safely, so you can be confident you have a fully qualified team on board.

As you would expect from a business like ours, all works are carried out to current legislative requirements and we ensure that all materials removed from the site are quickly and safely taken to a licensed asbestos disposal waste site.
