MACH ONE SYSTEM

Mach One by IKO is a single layer roofing system which can be mechanically fastened, ballasted or bonded with polyurethane adhesive. The membrane may be used on either insulation or uninsulated roofs in conjunction with the other IKO Systems products.

The Mach One system consists of a bituminous membrane; heat activated detailing membrane and a self adhesive vapour control layer, Surefix insulation and a range of pre-formed metal details. The Mach One roofing system has been independently approved by the British Board of Agrément, certificate number 00/3760.

When combined with the heat activated vapour control layer and Mach One heat activated detailing membrane. Mach One forms a completely flame free roofing system.

Mach One comes with a 20 year guarantee which covers materials, design and workmanship via a IKO specification, when installed by a IKO Mach One approved contractor.
